Front Facing Camera KST-1043 Order-no: 1043 9 0000_1

Forward Facing CCTV systems provides a „driver-eye“-view to the track and it's environment. Images recorded from the leading and trailing cabs make possible an investigation and reconstruction of evidences and provide information about the infrastructure concerning necessary maintenance, littering, damages etc.

The camera KST-1043 is adapted to the wind shield glass or the position light glass. The direct adaption realizes an effective elimination of optical influences of the video image. A heated camera front is responsible to a moisture free field of view.

The camera corresponds to valid railway standards in described configuration and under the use of a camera board set recommended by KST GmbH. On request, the cameras can be certified by an external laboratory.
